Contents

Engineering Materials

Chapter 1

Introduction	1
1.1 Material Classification.....	1
1.2 Metals	2
1.3 Ceramic Materials.....	2
1.4 Organic Materials	2
1.5 Polymers.....	3
1.6 Composites.....	3
1.7 Semiconductors	3
1.8 Engineering Requirements of Materials	3
1.9 Non Metals	4
1.10 Type of Bond.....	4

Chapter 2

Chemical Bonding	5
2.1 Basic Laws of Chemistry	5
2.2 Fundamental Concepts.....	6
2.3 Electrons in Atoms.....	7
2.4 The Periodic Table.....	7
2.5 Comparison of Alpha (α), Beta (β) and Gamma (γ) Rays.....	8
2.6 Quantum Number	9
2.7 Electron Affinity	11
2.8 Electronegativity	11
2.9 Pauli's Exclusion Principle:.....	12
2.10 Auf-bau Principle.....	12
2.11 Hund's Rule.....	12
2.12 Heisenberg Uncertainty Principle.....	13
2.13 Gay Lussac's Law of Gaseous Volumes	13
2.14 Dalton's Atomic Theory.....	13
2.15 Rutherford Model	13
2.16 Bohr Model.....	14
2.17 Sommerfeld's Model.....	14
2.18 De Broglie Wave Equation:.....	14
2.19 Octet Rule	15
2.20 Boyle's Law (Pressure - Volume Relationship).....	15
2.21 Charles Law (Temperature - Volume Relationship).....	16
2.22 Gay-Lussac's Law (Pressure - Temperature Relationship)	17
2.23 Avogadro Law (Volume - Amount Relationship).....	17
2.24 Ideal Gas Equation.....	17
2.25 Dalton's Law of Partial Pressures.....	17

2.26 Chemical Bonding	18
2.27 Ionic Bond.....	18
2.28 Covalent Bond.....	19
2.29 Metallic Bond.....	21
2.30 Comparison of Primary Bonds	21
2.31 Van der Waal Bond.....	22
2.32 Dispersion Bonds	22
2.33 Dipole Bonds	23
2.34 Hydrogen Bonds.....	23
2.35 Properties of Water (H ₂ O)	24
2.36 Directional Bond.....	25
2.37 Non-directional Bond.....	25
2.38 Molecular Orbital Theory	25
2.39 Hybridization	26

Chapter 3

Crystal Structure.....	28
3.1 Introduction.....	28
3.2 Coordination Number and Atomic Packing Factor.....	31
3.3 Space Lattice.....	31
3.4 Face Centered Cubic Lattice.....	31
3.5 Body Centered Cubic Lattice	32
3.6 Diamond Cubic (DC) Structure	33
3.7 Hexagonal Closed Packing	34
3.8 Mechanism of Crystallization	34
3.9 Miller Indices.....	38
3.10 Miller indices of a given direction.....	39
3.11 Inter planar spacing $d_{(hkl)}$	40
3.12 Linear density (r_l)	40
3.13 Planar density (r_p).....	41

Chapter 4

Crystal Imperfections	51
4.1 Introduction.....	51
4.2 Point Defects.....	51
4.3 Dislocations.....	55
4.4 Significance of Dislocations	60
4.5 Influence of Crystal Structure	61
4.6 Surface Defects.....	63
4.7 Importance of Defects.....	66

Chapter 5

Material Properties 72

5.1 Different Mechanical Properties.....	72
5.2 Factors Affecting Mechanical Properties.....	78
5.3 Effect of Grain Size on Properties of Metals.....	79
5.4 Strengthening Mechanism.....	79
5.5 Bauschinger Effect.....	80

Chapter 6

Mechanical Tests..... 83

6.1 Fracture.....	83
6.2 Ductile Fracture	84
6.3 Brittle Fracture.....	86
6.4 Shear Fracture	87
6.5 Cleavage Failure.....	87
6.6 Fatigue Failure	88
6.7 Mechanical Tests.....	88
6.8 Hardness Testing	89
6.9 Impact Testing.....	90

Chapter 7

Phase and Phase Diagrams 92

7.1 Introduction.....	92
7.2 Phase Diagram	93
7.3 Cooling Curves.....	94
7.4 Phase Transformation.....	95
7.5 Phase Diagram Interpretation.....	96
7.6 Equilibrium Phase Diagrams.....	98
7.7 Development Of Microstructures in Iron-Carbon Alloys	102

Chapter 8

Ferrous Material and Alloys 110

8.1 Pig Iron	110
8.2 Wrought Iron	111
8.3 Iron	112
8.4 Ferrous Alloys	112
8.5 Steel	112
8.6 Cast Iron Types (> 2 wt % carbon).....	119

Chapter 9

Non-Ferrous and Their Alloys 121

9.1 Aluminium.....	121
9.2 Titanium	124

9.3 Zinc	125
9.4 Copper	126
9.5 Lead	128
9.6 Tin	128
9.7 Tin-based Babbitt and Lead-based Babbitt	128
9.8 Nickel (Ni).....	129
9.9 Cobalt	130
9.10 Magnesium.....	130
9.11 Tungsten	131
9.12 Solder Material.....	131
9.13 Super Alloys	131

Chapter 10

Heat Treatment Process..... 132

10.1 Introduction.....	132
10.2 Heat Treatment Processes.....	133
10.3 Case Hardening	136
10.4 Time Temperature Transformation (TTT) Diagram ...	139
10.5 Factor Responsible for the Curve	140
10.6 Austempering.....	140
10.7 Martempering or Stepped Quenching	141
10.8 Hardening With Self Tempering.....	142
10.9 TTT Diagram for Hypoeutectoid and Hypereutectoid Steels.....	142
10.10 Austenitic stainless steel.....	142
10.11 Hardenability Curves.....	143
10.12 Heat Treatment of Nonferrous Alloys and Stainless Steels	143
10.13 Defects in Heat Treatment.....	144

Chapter 11

Nano Material 147

11.1 Nano Technology	147
----------------------------	-----

Chapter 12

Ceramic Materials..... 150

12.1 Classification	150
12.2 Raw Material	150
12.3 Properties of Ceramics Materials.....	151
12.4 Uses	151
12.5 Crystal Structure of Ceramics	152
12.6 Material Preparation for Ceramics	155
12.7 Toughening of Ceramics.....	157
12.8 Glass	160
12.9 Silicates	162
12.10 Carbon	162

Chapter 13

Composites..... 163

13.1	Definition of a Composite Material.....	163
13.2	Merits and Demerits of Composite Materials.....	163
13.3	Matrix Phase and Dispersed Phase.....	164
13.4	Composites Applications.....	165
13.5	Classification.....	165
13.6	Whiskers.....	173
13.7	Hybrid Composite.....	174
13.8	Cemented Carbides.....	174
13.9	Comparison with Metals.....	175

Chapter 14

Polymers 176

14.1	Introduction.....	176
14.2	Basic Definitions.....	177
14.3	General Characteristics of Polymer.....	178

14.4	Molecular Structure of Polymers.....	178
14.5	Different Types of Polymerizations Reactions.....	180
14.6	Co-polymer.....	180
14.7	Classification of Plastics.....	181
14.8	Thermoplastic Materials.....	182
14.9	Thermosetting Materials.....	183
14.10	Trade Name, Characteristics and Applications for some Important Plastic Materials.....	186
14.11	Mechanical Behaviour of Plastics.....	187
14.12	Compounding Materials.....	187
14.13	Comparison of Polymers with Ceramics and Metals.....	188
14.14	Elastomer.....	188
14.15	Fibre.....	188
14.16	Coatings.....	189
14.17	Vulcanization.....	189
14.18	Stress-Strain Behavior of Polymers.....	190
14.19	Advanced Polymeric Materials.....	191
14.20	Crystallization of Polymers.....	191

Introduction

INTRODUCTION

Material Science is a combination of solid state Physics and solid state Chemistry. The elements are divided into categories like metals, nonmetals, polymers and ceramics. A material relates itself to matter. Material comprises a wide range of metals and non-metals which must be operated to form the finished product.

1.1 Material Classification

Most engineering Materials may be classed into one of the following types:

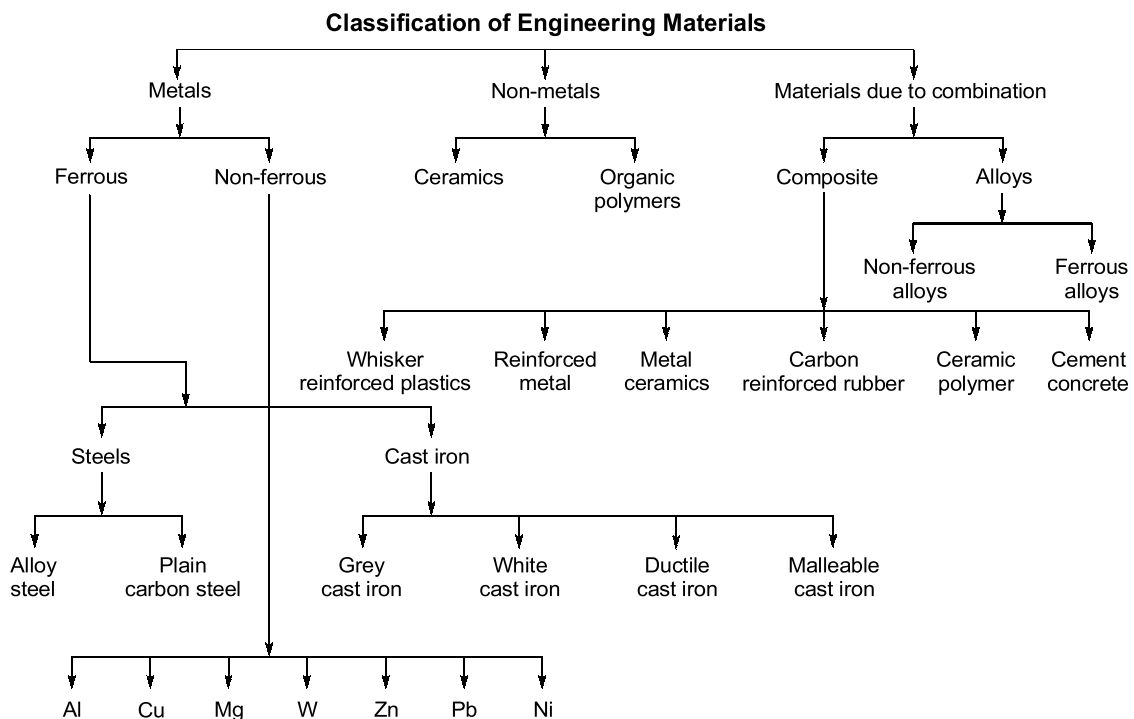

Fig.

1.2 Metals

Metals are the ones which have free electrons. They are capable of changing shape upon machining and gives good finish. At room temperature they are usually solid (except mercury) and to some extent they are malleable and ductile. Metal are good conductors of heat and electricity. Example copper, silver and gold etc.

1.2.1 General Characteristics of Metals

- | | | |
|----------------------------------|---------------------------------------------|----------------------------|
| 1. Luster | 2. Hardness | 3. Low specific heat |
| 4. Plastic deformability | 5. Good thermal and electrical conductivity | |
| 6. Relatively high melting point | 7. Strength | 8. Ductility |
| 9. Malleability | 10. Opaque | 11. Stiffness |
| 12. Rigidity | 13. Formability | 14. Machinability |
| 15. Weldability | 16. Castability | 17. Dimensional stability. |

Examples of commonly employed metals are :

Iron, Aluminium, Copper, Zinc, Magnesium, etc.

1.3 Ceramic Materials

- Ceramics usually consist of oxides, nitrides, carbides, silicates of various metals.
- Ceramics are any inorganic, non-metallic solids (or super-cooled liquids) processed or used at high temperatures.
- Ceramic materials are rock or clay mineral materials.
- Ceramic materials contain compounds of metallic and non-metallic elements, such as MgO, SiO₂, SiC, BaTiO₃, glasses, etc. Such compounds contain both ionic and covalent bonds.

Important characteristics of ceramics are :

- | | |
|------------------------------------|---------------------------------------------|
| 1. Brittleness | 2. Rock-like appearance |
| 3. Resistance to high temperatures | 4. Hardness |
| 5. Abrasiveness | 6. Insulation (to flow of electric current) |
| 7. Corrosion resistance | 8. Opaque to light |
| 9. High temperature strength | 10. High strength in compression |

Examples of ceramic materials are :

Sand, Glass, Brick, Cement, Concrete, Insulators, Silicon Carbide, Tungsten Carbide, Boron Nitride, Refractories, Abrasives, Plaster.

1.4 Organic Materials

- They are polymeric materials composed of carbon compounds. (Polymers are solids composed of long molecular chains.)
- There are countless organic materials, natural, synthetic or manufactured and based chemically on carbon.

Important characteristics of organic materials (e.g. wood, rubber and plastic) are:

- | | | |
|----------------|----------------|---------|
| 1. Lightweight | 2. Combustible | 3. Soft |
|----------------|----------------|---------|

4. Ductile
5. Not dimensionally stable
6. Poor conductors of heat and electricity
7. Poor resistance to temperature, etc.

Examples of organic materials are:

Rubber, Plastics, Paper, Fuels, Wood, Lubricants, Textiles, Paints, Adhesives, Explosives

Organic material find its place in:

1. Electric Insulation
2. For improving appearance
3. Fuels
4. As Vitamins and Medicines
5. For protection against corrosion, high temperature, weather, etc.
6. Refrigerants
7. Adhesives
8. Lubricants
9. Detergents
10. Explosives

1.5 Polymers

Polymers include the familiar plastic and rubber materials. Many of them are organic compounds that are chemically based on carbon, hydrogen and other non-metallic elements; furthermore, they have very large molecular structures. These materials typically have low densities and may be extremely flexible.

1.6 Composites

Composite materials consist of more than one type of material. Most common example is fiberglass in which glass fibers are embedded within a polymeric material. There are two parts in composite namely Reinforcement and Matrix. A composite is designed to display a combination of the best characteristics of each of the component materials. Fiberglass acquires strength from the glass and flexibility from the polymer. Hence fiberglass is the reinforcement and the polymer material is the matrix.

1.7 Semiconductors

Semiconductors have electrical properties that are intermediate between the electrical conductors and insulators. Furthermore, the electrical characteristics of these materials are extremely sensitive to the presence of minute concentrations of impurity atoms, these concentrations may be controlled over very small spatial regions. The semiconductors have made possible the advent of integrated circuitry that has totally revolutionized the electronics and computer industries.

1.8 Engineering Requirements of Materials

- Engineering requirements of a material mean as what is expected of from the material so that the same can be successfully used for making engineering components such a crankshaft, connecting rod, etc.

- When an engineer thinks of fabricating an engineering part, he goes in search of that material which possesses such properties that will permit the component part to perform its functions successfully while in use. For example, one may select high speed steel for making a milling cutter or a power hacksaw blade.
- The main engineering requirements of materials fall under three categories :
 1. Fabrication requirements
 2. Service requirements
 3. Economic requirements.

Fabrication requirements mean that the material should be able to get shaped (**e.g.**, cast, forged, formed, machined, sintered etc.) and joined (**e.g.**, welded, brazed, etc.) easily. Fabrication requirements relate themselves with materials' machinability, ductility, castability, heat-treatability, weldability, etc.

Service requirements imply that the material selected for the purpose must stand up to service demands, e.g., proper strength, wear resistance, corrosion resistance, etc.

Economic requirements demand that the engineering part should be made with minimum overall cost. Minimum overall cost may be achieved by proper selection of both technical and marketing variables.

1.9 Non Metals

The materials in the right portion of the periodic table are called non metals. These materials are usually brittle and poor conductor of electricity (except graphite). They does not form alloys but combine chemically to form compounds.

1.10 Type of Bond

Solid state exhibits a crystal structure which is having a definite geometry except amorphous state like glass. In crystal structure there are four types of bonding force:

1. **Ionic Bond** : Strong electrostatic attraction between cations and anions is called ionic bond. These bonds are permanent and atoms doesn't drift throughout the lattice structure.
2. **Covalent Bond** : In this type of bond there is a sharing of one or more electrons from the adjacent atoms.
3. **Metallic Bond** : Metallic bond is formed when material (metal) have one, two or there valence electrons. These electrons are not bound to any particular atom in the solid and drift through out the entire metal.
4. **Vander Waals Forces** : These are attractive forces that hold molecules close together. These attractive forces are more commonly referred to as intermolecular forces. The bond formation generally takes place in neutral atoms like inert gases.
